

INTRODUCTION TO PCYNLITX INSTALLATION

Currently, Pcynlitx only works on GNU/ Linux based operating systems. Windows and macOS versions will be developed as soon as possible. The pcynlitx is installed directly from the command line interface. The install scripts automatically download related installation packages from the project repository and perform all of the required operations for you. For the installation, root privilege is required. The type of installation packages and their installation scripts are given in below.

There are three type install files which are given in below.

LINUX DISTRIBUTION	THE INSTALLATION FILE	PACKAGE
Ubuntu	ubuntu_install.sh	pcynlitx_ubuntu.deb
Debian	debian_install.sh	pcynlitx_debian.deb
Fedora	fedora_install.sh	pcynlitx_fedora.rpm

Alternatively, you can directly download the packages and install with the commands that are given in below.

Ubuntu : `sudo apt-get install ./pcynlitx_ubuntu.deb`

Debian : `sudo apt-get install ./pcynlitx_debian.deb`

Fedora : `sudo dnf install pcynlitx_fedora.rpm`

In pcynlitx, wxWidgets library is used as user interface toolkit. Thus, on the installation process, basic wxWidgets tools are installed by the installation script. In addition, some fonts and “evince pdf reader” are installed by the installation script.

Clonning the Project:

In order to clone the project, please open the terminal and type the command that is given in below.

```
~$ git clone https://sourceforge.net/projects/pcynlitx/code PCYNLITX.PROJECT
```
